

DLM 705

With the expansion of the flat honing technology in the field of 1-, 2- and 3-wheel machines (DLM series) we recognized at an early stage the necessity of this technology for new customer demands and made further developments.

With the DLM series STÄHLI today also combines the most modern mechanical engineering technology with the latest control and measuring technology in connection with automation in different expansion stages.

FLM 1000

The 1-wheel flat lapping and polishing machines of the FLM series with wheel diameters from 500 to 4000 mm are perfectly optimized for production output.

With its particularly robust design including loading and unloading devices this series is very well suited for mass production with the special feature of wheel correction by means of central geometry adjustment.

FLM 500

Moreover, through the extension of the FLM series, we have continuously developed and adapted the construction of special machines according to customized requests.

Through the combination of the FLM series as well as special machines for glass processing, the STÄHLI Group probably offers the most complete production and sales program in the 1-wheel sector.
